

ENCRYPTED LOCAL EXPENSE WALLET

The calendar that never leaves this browser.

Current funds, projected income, and a private ledger wrapped in AES-256-GCM. No accounts. No cloud. One MIT-licensed static app.

A banking-grade wallet with no bank in the middle.

OpenExpense is a static GitHub Pages app. The browser is the runtime. There is no application server, no user account, and no first-party ledger upload. Autosave encrypts the calendar in IndexedDB. Export writes an encrypted ledger.json and a sibling key.json that you keep.

SETTLED CASH

Paid in – paid out

Pending and future days do not count toward available funds.

ONE EVENTS MAP

Expense + income

Green paycheck pills and navy bills share one month grid.

WHO IT IS FOR

Households, contractors, and host apps

- People who want a calendar wallet without creating an account
- Anyone who must keep a portable encrypted backup they control
- Banks and tools that already fetch transactions and need a private UI/engine

ARCHITECTURE

Capabilities that stay on-device.

Calendar wallet

Month grid with net-up / net-down badges. Drag a chip to another day to move it.

Snapshot slides

Overview, Income, and Expenses. Unpaid bills stay separate from still-expected paychecks.

Recurring series

Weekly, monthly, bimonthly, or quarterly. Edit or delete one weekday or the whole series.

Encrypted autosave

AES-256-GCM in IndexedDB. The device key is non-extractable and is not key.json.

Portable export

Encrypted ledger.json plus a sibling key.json. Linked-folder Save stages a recovery pair first.

On-device OCR

Receipt photos and PDFs are parsed in the page. Images are not uploaded.

Monthly PDF

A brochure spending or income report is generated locally with the same navy tokens.

Host engine

engine.js and window.OpenExpense let a banking app set and get calendar data. No Plaid calls here.

From first open to a key you can hold.

- 1

Open a secure context
Use <https://www.openexpense.org> or localhost. Do not open the HTML as file://. Encryption needs a secure context.
- 2

Name the ledger
Autosave is on by default. The disk icon writes an encrypted record to this browser only.
- 3

Tap a day and add a line
Save an expense or income. Mark paid or received. Recurring copies land on the cadence you choose.
- 4

Scan if you want a draft
Camera or file. OCR and PDF text run locally. Confirm the merchant and amount before save.
- 5

Read the snapshot slides
Overview is settled cash and bills. Income shows still-expected checks. Expenses shows unpaid bills.
- 6

Export both files
Keep ledger.json and key.json together, or apart on purpose. Anyone with both can decrypt that export.

STANDARD OPERATING PATH

Import later with the matching key.json. A plaintext JSON import is allowed only after you confirm, then it is stored encrypted.

SYSTEM SPECS

- Version 2.2.0 · MIT License
- AES-256-GCM · 96-bit IVs
- IndexedDB ledger + meta key
- Static GitHub Pages host
- Secure context required
- engine.js ~13 KB headless API

PRIVACY

No accounts. No analytics collector. Receipt pixels stay in-page. The portable key is not written to IndexedDB or localStorage. A browser-profile attacker remains out of scope, as stated in SECURITY.md.

Open the wallet. Keep the key.

Go to openexpense.org, or run the repo locally and open <http://localhost:8765>. Add a day. Export both files. That is the whole product promise.
